## Best real likes for instagram

Whenever I open Instagram these days, it feels like I'm being watched. The moment I follow a new person or double-tap a landscape or cat image, the photo-sharing app – which I've long been addicted to – picks up and shows me remarkably similar images. It's almost creepy. As it turns out, Instagram's algorithms are indeed keeping an eye on me, eagerly drawing a complex map of my likes, followers, and other in-app behaviors, and those of the people I like as well. As the app learns, its Explore tab will be better at recommending photos and videos to me. I can't help but take the bait. Next, I know I'm going down a new visual rabbit hole and following six more people. The Explore tab is essentially a huge recommendation engine. But the ever-evolving method that Instagram uses to sort one of the world's largest networks of photos, comments and likes is much more complex than your standard, if you like that, you'll like this logic. And surprisingly, Instagram says that despite the image recognition capabilities of parent company Facebook, there is no image vision. The Instagram Explore TabExplore, the section of Instagram called by a small magnifying glass, is where the app suggests pictures and videos that you might appreciate, and allows you to search for more by day, username or location. This infinite and constantly refreshing grid of images does its best to reflect your interests. Mine shows a mixture of musical instruments such as drums and synthesizers, various animals, blurry film photographs, tattoos, strange psychedelic art, food, beach scenery and occasional meme. You can see political rallies, yoga poses, makeup tutorials, shirtless Justin Bieber pictures, corgis, vintage cars, and whatever it is that you happen to be – even if you didn't know you were. For one of us, some of the suggestions may seem strangely off-base. But for the most part, they attract us more and more often. And in a week or two, depending on how much you swipe and type through Instagram, this page might look very different. With tens of millions of images shared on Instagram on a typical day, how does the Explore tab find out what to show us? The process is twofold. First, the algorithms embark on a content quest known within the company as sourcing. To make its way through Instagram's vast jungle of image uploads, the system uses a mix of your own behavior – which images you liked, who you follow, what types of images you share, and data about the people you follow, including the types of posts you like, for the – to limit millions of images to just a few hundred. It even analyzes the activity of people who follow the same accounts that you do. Supported by Instagram's machine-learning capabilities, the process is gradually becoming more sophisticated and eerily more accurate for many users. You put [the predictions] on an action, and then you do things around that action, says Layla Layla a product manager at Instagram working on Explore. The following is an explicit action. Liking is another explicit action. You have all these different permutations of what you can look at. For example, if you and I both happen to follow six of the same people, maybe you will post a photo of a seventh account that I follow, but that you've never heard of. The Instagram algorithm will test this theory by slipping one of its posts into your Explore page. For this reason, if you scroll through Explore enough, you can occasionally see a familiar face – say, a friend of a friend or someone you recognize from all over the city. Instagram mining the complex, multi-layered social web between users and trying to learn how these people interact with each other. Photo of John Paul TitlowInstagram can also take advantage of the mountains of data and social links that its users generate on Facebook to suggest photos, people and ads. Remarkably, however, the Explore algorithm does not use Facebook's image recognition technology to understand the content of images. Instead, the referral algorithms take clues from things like hashtags, subtitles, and the overarching theme of the account itself (which it finds out from

the account description and user behavior around it). An Instagram account, for example, that flies with food, cats or guitars, is filled with photos of these special things. The system then tries to organize the images according to how likely they are relevant to you – and thus how likely it is that you are performing a new action, e. B like the photo or follow the account. These predictions are made with a further analysis of your previous behavior on Instagram – and then used to assign a numerical score to each image so that the system can prioritize which images you show. At this point, Instagram's sea of millions of videos and photos is narrowed to just a few dozen and personalized just for you. The app also strives to further unravel things by blocking certain content; Instagram recently started shadowing excessive spam accounts, preventing their photos from appearing on the Explore tab. One of the challenges of the Explore tab is to find a balance between personalization and serendipity. You might want a good amount of cat content, but not that the whole experience is cats, says Amjadi. It is not only to play the same thing to people, but also to help them broaden their horizons so that they could also be interesting. With 700 million Instagram users spread around the world, the Explore page often shows things but also offers a glimpse into another culture elsewhere. Maybe you're in Garage Rock, but you've never heard of this up-and-coming band from Australia just playing a gig in Sydney last night. Look at them. Or maybe you're in makeup how-to's, but have never seen eyeliner done quite the way this teenager in Sao Paulo did on her Instagram feed this Explore Tab has come a long way since Instagram first took off in 2010. Originally known as Popular, this part of the app began as a showcase of the network's most popular images at a certain point in time. Unsurprisingly, the experience quickly became boring. So the company began trying to personalize it in 2014, two years after Facebook bought it. Explore, as it was now called, worked: In an early A/B experiment, the addition of personalization showed a 400% increase in engagement. The following year, the company added videos and trend tags, improved search functionality, and placed more emphasis on viewing images by location. Since then, they have swappered various features and optimized details as they try to quietly improve background personalization. It's always iterative, says Amjadi. People's behaviour is changing. The ecosystem is changing. The content produced changes. Everything changes, so you can't just do it and let it sit. Add your recommendations for Instagram alternative apps in the comments section below! Instagram is currently embroiled in more than a minor controversy. The chaos has stoked some serious user anger as it seems to leave Instagram (or, rather, its new imperial overlord Facebook) selling their photos for its own profit. Where else can a privacy-minded, photo-loving smartphone owner turn for the same type of filter effect images? Glad that you asked. Hipstamatic. Some smartphone camera fans used Hipstamatic before Instagram barely added a glowing halo to a single image. Hipstamatic has an interface that allows you to apply much more different effects than Instagram – including tinkering with any effect by exchanging the lens, flash of the virtual camera, flash and even movie. As a bonus, you can use the user interface to share your square, filter-infested photos via Facebook, Twitter, Flickr and even Instagram. (No. 1 on iPhone) Camera Awesome. Camera Awesome is much more playful than Instagram or Hipstamatic, but under its cheeky style (you don't filter photos, as much as you choose how much you want them to awesome) there are great built-in tips for taking good photos. In addition, it provides precise control over the effects (some of which you need to buy) – although this means that it takes a little longer to use it. On the plus side: It shares more networks than Hipstagram, (free on iOS)Camera Fun. Perhaps the easiest app on this list, Camera Fun is also all about photo filters that are much crazier than what Instagram offers – including weird options like night vision mode. (No. 1 for iPhone and Android)100 in 1. With a very attractive interface, 100 cameras in 1 could be a photographer favorite – and his quick search array of filters (each with a nice set describes what it does) makes for fast photo snapping. You can even go layer effects on top of each other completely filter crazy. (No. 2 on Let's face it, much of Instagram's appeal was in its fast interface and social-sharing angle, which led to warm, cozy feelings when someone liked one of your photos. Twitter is now building in photo filters and it's already a very popular social network. So sure, its filters aren't necessarily awesome at the moment (and, no, they can't awesome), but for many people it may be worth simply using Twitter instead of jumping into another app. (free on iOS, Android) [Slide Show Images: Kit Eaton] Chat about these messages with Kit Eaton on Twitter and Fast Company too.
